Research Interest

Deep Learning, Training Dynamics, Statistical Learning Theory, Foundation Models, Reinforcement Learning

Research Highlights

Thread I: Foundations of Learning, Training Dynamics & Interpretability

How transformers pick up features and circuits during training, and when learning is possible at all.

- **Unveiling Induction Heads: Provable Training Dynamics and Feature Learning in Transformers**
  First end-to-end characterization of how a transformer with an FFN learns induction heads, the attention circuits behind in-context learning.
  NeurIPS 2024 · **Invited Talk**, FAI Seminar 2024
- **Training Dynamics of Multi-Head Softmax Attention for In-Context Learning: Emergence, Convergence, and Optimality**
  First end-to-end characterization of the full training dynamics of multi-head softmax attention, proving convergence to the optimal in-context learning algorithm.
  COLT 2024 (**Oral**) · ICLR 2024 Workshop on Bridging the Gap Between Practice and Theory in Deep Learning · **Invited Talks**, Workshop on the Theory of Decision Intelligence, RLChina 2024, and FAI Seminar 2024
- **Can Neural Networks Achieve Optimal Computational-Statistical Tradeoff? An Analysis on Single-Index Model**
  Proves that neural networks trained by gradient descent reach the optimal sample complexity for single-index models, matching statistical-query lower bounds.
  ICLR 2025 (**Oral**)
- **Taming Polysemanticity in LLMs: Theory-Grounded Feature Recovery via Sparse Autoencoders**
  Gives the first provable guarantees for feature recovery with sparse autoencoders. The resulting Group-wise Bias Adaptation algorithm finds cleaner, more interpretable features in real LLM activations.
  ICLR 2026 · **Invited Talk**, FAI Seminar 2025

Thread II: Pretraining, Scaling & Latent Reasoning

How data, architecture and optimizer choices shape what a model learns, how that changes with compute, and how models can reason in latent space.

- **Truncate or Not? A Scaling Study of Looped Transformers with Truncated Backpropagation**
  Develops a scaling law for looped transformers that jointly accounts for model size, training tokens, and forward and backward loop counts. At matched compute, it shows when full backpropagation through fewer loops beats truncation.
  Preprint, 2026
- **Unlocking Out-of-Distribution Generalization in Transformers via Recursive Latent Space Reasoning**
  Introduces recursive latent-space reasoning, which lets transformers generalize to inputs far outside the training range. Probing shows what the trained looped transformer computes at each loop.
  Journal of Machine Learning Research (minor revision)
- **Towards Understanding Momentum Acceleration in River-Valley Loss Landscape**
  Explains why momentum speeds up training on the river-valley loss landscapes seen in LLM pretraining: it allows a much larger learning rate, which drives faster progress along the river.
  NeurIPS 2026 · ICML 2026 Workshop on High Dimensional Learning Dynamics: the Science of Scaling (**Spotlight**)

Thread III: Post-training & Self-Evolution

Helping models improve their own reasoning through RL and curricula they write themselves.

- **INFUSER: Influence-Guided Self-Evolution Improves Reasoning**
  A generator and a solver train together. The generator writes problems grounded in documents and learns which ones actually help the solver, using influence scores. The solver's reasoning improves as the curriculum evolves.
  NeurIPS 2026 · **Invited Talk**, NICETalk 2026
- **GPT-Driven Drug Optimization with Structured Policy Optimization Post-training**
  Post-trains a GPT model with structured policy optimization to improve drug candidates, tested on SARS-CoV-2 and human cancer benchmarks.
  MLHC 2026
- **Benchmarking AI Agents for Addressing Scientific Challenges Across Scales**
  Introduces SciAgentArena, about 200 real research tasks with stepwise checks and an interactive environment for testing AI agents. Agents do well on clear data-analysis workflows but struggle with open-ended research.
  Preprint, 2026

Education

Doctoral Student — **Yale University**, Statistics and Data Science — Sept. 2022 to now

- *Coursework:* Linear models, Statistical Inference, Practical Work, Data Analysis, Intermediate Machine Learning, Advanced Optimization
- *Advisor:* Prof. Zhuoran Yang

Bachelor of Science — **Tsinghua University**, Electronic Engineering — Sept. 2018 to May 2022

- *Coursework:* Convex Optimization, Computer Program Design, Linear Algebra, Probability and Stochastic Processes, Theory and Methods for Statistical Inference
- *Honors & Awards:*
  - Comprehensive Excellence Scholarship
  - China National Scholarship

Experience

Yale University, Teaching Assistant — CT, USA

- Information Theory (S&DS 364) — Feb 2024 to May 2024
- Optimization and Computation (S&DS 431) — Sep 2024 to Dec 2024
- Deep Learning for Scientists and Engineers (S&DS 266) — Feb 2025 to May 2025

Google Research, Student Researcher — CT, USA

- Research on test-time scaling behavior and workflow optimization for large language models. — June 2025 to Dec 2025

Tencent Hunyuan, Qingyun intern — Beijing, China

- Omni LLM pretraining and gradient-information-based data improvement. — Aug 2026 to now
